The panel of arbitrators included a former judge from the United States District Court for the Western District of Pennsylvania and two former litigation department heads at AmLaw 100 law firms.Bruce Carlson was co-lead counsel for the class and Carlson along with his partner Gary Lynch led the Carlson Lynch trial team that tried the case.

This extremely student-friendly text uses a "just-in-time" format which develops circuit concepts and techniques at an introductory level before progressing to more sophisticated topics. Includes a brief discussion of the classical solution of differential circuit equations but the primary emphasis is on modern engineering methods such as phasors, network functions, Laplace transforms, and state equations. When a particular technique involves several parts, it is presented as a procedural algorithm enabling students to clearly perceive the successive steps. Contains over 200 worked examples, 240 exercises, and 1000+ problems.

A fundamental goal of neuroscience is to understand how the nervous system extracts biologically relevant information from the natural environment and how it uses that information to guide and coordinate behavior necessary for reproduction and survival. The electrosensory systems of weakly electric teleost fishes and those of nonteleost fishes are attractive systems for addressing basic questions about neuronal information processing and its relationship to natural behavior. Comparative approaches in these fishes have led to the identification of fundamental mechanisms that have shaped the adaptive evolution of sensory systems across animal taxa. Understanding how sensory systems encode and integrate information about the natural world has far reaching implications for advancing our knowledge in the basic biomedical sciences and in understanding how the nervous system has evolved to control behavior. The primary goal of this book is to provide a comparative perspective on the topic of electroreception and review some of the fundamental insights gained from studies of electrosensory and electromotor systems. Although totally independent, this book follows from volume 21 in the Springer Handbook of Auditory Research series, Electroreception (Bullock, T. H., Hopkins, C. D., Popper, A. N., and Fay, R. R., 2005, Springer-Verlag, New York).

This text allows students to learn the fundamental concepts in linear circuit analysis using a well-developed methodology that has been carefully refined through classroom use. Applying his many years of teaching experience, A. Bruce Carlson focuses the reader's attention on basic circuit concepts and modern analysis methods. He systematically unfolds each idea, covering studies of node and mesh equations, phasors, the s-domain, Fourier series, Laplace transforms and state variables in a practical "just-in-time" manner. In applying his methodology for study and understanding, each chapter begins with a list of action-oriented learning objectives and follows through to a summary of the major relevant points and relationships. He also provides students with an abundance of practical, worked examples and exercises to help them master the topics.
