Excerpt from Diptera  
Brachycera, Vol. 1 In the  
first volume devoted to the  
Diptera in the "Fauna of  
British India" Series, the  
two great suborders,  
Orthorrhapha and  
Cyclorrhapha, into which the  
order is now generally  
divided, were sufficiently

characterised, and a comparison was also given between the Nematocera and Brachycera, into which the first suborder is subdivided. The earliest writers divided the Diptera into Nematocera and Brachycera, of subordinal rank based mainly on palpal and antennal characters, and not on those of the venation or early stages, this classification finding favour until towards the close of the last century. Nowadays the old series of brachycerous families is split at or near the Lonchopteridae:, all those from the Stratiomyidae to that family being included

in the Orthorrhapha Brachycera; the remainder, consisting of the Platypezidae, Pipunculidae, Syrphidae, Conopidae and stridae:, the enormous family Muscidae (sensu latissimo), and the pupiparous Diptera (the last-named forming in themselves a separate group of uncertain rank) constituting the Cyclorrhapha. One anomalous family, the Phoridae, is by some placed next the Lonchopteridae in the Orthorrhapha Brachycera, and by others next to the Muscidae in the Cyclorrhapha. The formation of groups of higher rank than families has received

the attention of many dipterologists of note, and Verrall gives an excellent resume of Brauer's (1883) and Osten-Sacken's (1896) views. Verrall himself admitted that there were several points in Brauer's tables that were not clear to him and others with which he could not agree, and it may here be observed that Brauer's primary divisions or suborders of Orthorrhapha and Cyclorrhapha have been criticised as lately as 1907 by Prof. Miall. Verrall, in noting this in a footnote, adds, "I quite agree with this distinguished savant in considering the two divisions, Orthorrhapha and
