This book presents a variety of perceptions of and perspectives on infection prevention and control. In doing this, the chapters will reflect upon challenging and controversial new ways of looking at infection prevention and control aimed at generating both discussion and debate as well as practical solutions. With this in mind, the book will aim not only to challenge the existing status quo but also push the frontiers of knowledge, thinking and practice where infection prevention and control is concerned. This is vital when considered in the light of cross infection rates, the number of healthcare providers who are being identified by the Care Quality Commission as falling below acceptable standards of infection prevention and control and the almost compulsive persistent non-adherent behaviours of those involved in the provision of medicine, health, social care and other disciplines related to caring with regards to the undertaking of safe and appropriate standards of infection prevention and control. There is no doubt that this book will be challenging with regards to the readers' perceptions and perspectives of infection prevention and control. Where this topic is concerned however, such a challenging approach is vital if the health, safety and well being of individuals is to be positively promoted among all those involved in the health and wellbeing of others.

"It has been estimated that in developed countries up to 10% of hospitalized patients develop infections every year. Not only is there a substantial cost to healthcare systems, but some healthcare associated infections (HCIA) can be fatal. Since the majority of HCIA are preventable, reducing HCIA is now considered to be an integral part of patient safety and quality of care provided by all healthcare institutions worldwide. Unlike other books on infection control, the main strength of this book is to provide clear, up-to-date and practical guidance in infection control in an easy to read format which can act as a quick source of reference on all aspects of HCIA for healthcare workers who are either directly or indirectly involved in prevention and control of HCIA. Although the book's main audience is infection control practitioners such as doctors, nurses, public health physicians, it is also a valuable reference for environmental health officers, health educators, practice managers in GP surgeries, and health service managers"--

A practical step-by-step guide for all members of the dental team Thoroughly updated, this new edition ensures all members of the dental team are up to speed on the practical aspects of infection prevention

and control. It provides step-by-step guidance on the safe running of a dental practice, clear and concise explanations of the key issues and concepts, an overview of the evidence base, and coverage of legal and regulatory issues about which all staff members need to be aware. With more colour photographs and illustrations than the first edition, it also includes appendices full of useful practical and clinical information, and a companion website offering helpful instructional videos and self-assessment questions. Key topics include communicable diseases, occupational health and immunization, sharp safe working, hand hygiene, personal protective equipment, disinfection of dental instruments, surface decontamination, dental unit waterlines, clinical waste management, and pathological specimen handling. An indispensable working resource for the busy dental practice, *Basic Guide to Infection Prevention and Control in Dentistry, 2nd Edition* is also an excellent primer for dental students.

*Germ and governance* brings together leading historians, practitioners and policy makers to consider the past, present and future of hospital infection control. Combining historical case-studies with practitioner experiences, this volume offers a new understanding of the emergence of theories of germ transmission and containment and how these theories played out in real-world environments, networks and professional organisations. Exploring the historical context in which technologies like gloves were developed and popularised, as well as how relationships between communities and hospitals, doctors and nurses, and the emerging role of hospital bacteriologists have shaped infection control practices, the collection emphasises the diverse contexts in which ideas about germs, infection and safety circulated. The volume also addresses the historical neglect of the critical role of nurses in the development and success of infection control measures.

Health care-associated infections (HAI) are one of the most common adverse events in care delivery and a major public health problem with an impact on morbidity, mortality and quality of life. At any one time, up to 7% of patients in developed and 10% in developing countries will acquire at least one HAI. These infections also present a significant economic burden at the societal level. However, a large percentage are preventable through effective infection prevention and control (IPC) measures. These new guidelines on the core components of IPC programmes at the national and facility level will enhance the capacity of Member States to develop and implement effective technical and behaviour modifying interventions. They form a key part of WHO strategies to prevent current and future threats from infectious diseases such as Ebola, strengthen health service resilience, help combat antimicrobial resistance (AMR) and improve the overall quality of health care delivery. They are also intended to support countries in the development of their own national protocols for IPC and AMR action plans and to support health care facilities as they develop or strengthen their own approaches to IPC. These are the first international evidence-based guidelines on the core components of IPC programmes. These new WHO guidelines are applicable for any country and suitable to local adaptations, and take account of the strength of available scientific evidence, the cost and resource implications, and patient values and preferences.

This Open Access volume provides in-depth analysis of the wide range of ethical issues associated with drug-resistant infectious diseases. Antimicrobial resistance (AMR) is widely recognized to be one of the greatest threats to global public health in coming decades; and it has thus become a major topic of discussion among leading bioethicists and scholars from related disciplines including economics, epidemiology, law, and political theory. Topics covered in this volume include responsible use of antimicrobials; control of multi-resistant hospital-acquired infections; privacy and data collection; antibiotic use in childhood and at the end of life; agricultural and veterinary sources of resistance; resistant HIV, tuberculosis, and malaria; mandatory treatment; and trade-offs between current and future generations. As the first book focused on ethical issues associated with drug resistance, it makes a timely contribution to debates regarding practice and policy that are of crucial importance to global public health in the 21st century.

Covering the issues, themes and principles that explain what it means to be a nurse today, this book provides the theory students need to know and applies it to the diverse patient groups and settings that students will encounter on their placements. Key features of the book are:

- Introduces the core aspects of adult nursing
- An evidence-based approach with discussion of literature, policy and research and suggested further reading for every chapter
- Over 30 case studies to help students understand the realities of practice across a range of settings including primary care and the community
- Stop and think boxes which challenge assumptions and encourage reflection
- A companion website with sample questions for lecturers to use in seminars, multiple choice questions for student revision and free SAGE journal articles

The book has been closely developed in line with the NMC Standards and Essential Skills Clusters and supports students across their entire degree programme as they develop into nurses of the future ready to deliver and lead care.
